Personal Data Processing Annex

Annex to the **Walkstamp** Terms of Use · Law 13.709/2018 (LGPD) · version of 2026-11-04

> **Courtesy translation.** This Annex is executed under **Brazilian law** — Law 13.709/2018 (LGPD) — and the **Portuguese version governs**: it is the one that is signed, and it prevails in case of any divergence. This translation exists so that a security or legal review can read the document without waiting for one. If your organisation requires an annex drafted under the GDPR instead, ask us before signing — the applicable law is a decision, not a translation.

This Annex supplements the Walkstamp Terms of Use and describes, for the organisation that uses the tool (the "**Customer**"), how personal data is processed in that use. It is offered by **Produtize Produtos e Serviços Inteligentes Ltda.**, company register (CNPJ) 48.417.292/0001-99 (the "**Provider**"). Walkstamp is free of charge and has no account.

> **The point that defines this Annex.** The Provider **does not process personal data on behalf of the Customer**. Walkstamp runs **entirely in the user's browser**: video, audio, screen images, transcripts and generated documents are **never transmitted to the Provider**. There is no processing server, no account and no Customer database. Vendor-review questions about retention, encryption or destruction of that content do not apply, because it never reaches the Provider — and the Customer can verify this itself with the browser's network inspector open on the Network tab.

1. Roles

1. The **Customer** is the **controller** of what it records and processes with the tool: it decides what is recorded, for what purpose and on what legal basis, and is responsible for informing the people who appear in the recordings.
2. The **Provider** does not receive, access or store that content, and therefore **does not act as a processor** of it (LGPD art. 5, VII). It provides the software, which the Customer runs in its own browser.
3. The Provider acts as **controller**, in its own name, only of the data described in its Privacy Policy — the technical access data the site's hosting receives, the aggregate visit count and the e-mails it receives. That data is outside the scope of this Annex.
4. No Customer content is used to train artificial intelligence models, the Provider's own or third parties': it never reaches the Provider.

2. Where processing happens

1. **Content of the recordings** — screens, audio, transcripts, annotations and generated documents: processed in the user's browser, on the Customer's device. It does not leave it, except through the optional features described in section 3, triggered by the user.
2. **Settings kept in the browser** — preferences, templates, client brand, the "Issued by" field and, if the user ticks the option, the vocabulary list: kept in the browser's local storage, under the Customer's control, and erased when the site data is cleared in the browser.

3. **Copy of a recording in progress** — the captured screens are mirrored to the browser's private file storage (*Origin Private File System*), so that a crash does not lose the work. The copy is deleted when a document is generated, after seven days or when the user discards it.

3. Sub-processors and third parties

There is no sub-processor: no third party engaged by the Provider receives Customer content. The user's browser connects directly to the third parties below. The list is the same one published in the Privacy Policy, and the published version prevails:

Third party	When	What it receives	What it never receives
Vercel — hosting of the site and the tool	Always, when any page opens	The request for each file of the page, with IP address, browser and address requested, in Vercel's access logs	Customer content
Vercel Web Analytics — visit counting	When a page of the site or the tool opens	On each page opened: the page address, where the visit came from, the country and the type of browser and device, for an aggregate count, with no cookie and no identifier that lasts beyond the day	Any person identifier, cookies, use of the tool, Customer content
jsDelivr — PDF library	When the PDF is generated, and only if the file served by the page itself is missing	The download request for the library	The Customer's audio, image or text
jsDelivr and Hugging Face — transcription model	When the user turns transcription on, or builds the technical report of the message	The download request for the program (jsDelivr) and for the model weights (huggingface.co and its file network). The model runs in the browser	The Customer's audio
jsDelivr — reading on-screen text	When the user asks to read the text of a screen	The download request for the reader and the language data. The reader runs in the browser	The Customer's image
Google — Google Drive and Google Docs, optional	Only if the user opens a video from Drive or sends a document to Google Docs, after confirmation	Authentication to the user's Google account, with the `drive.file` scope. When sending to Docs: **Customer content** — the generated document, which goes from the browser straight to the user's Google account	The rest of the Drive; nothing passes through the Provider
LinkedIn and the other share buttons	Only when the user clicks	The address of the site or the article, in an ordinary link	Any part of a Customer document

Sending to Google Docs is the only feature in which Customer content leaves the browser. The destination is the user's own Google account, and processing from then on follows the relationship between the Customer, or the user, and Google. It is for the Customer to decide whether that feature is allowed in its environment.

4. Customer responsibilities

1. To have a legal basis for the recordings and to inform the people recorded, as applicable law requires.
2. Not to capture unnecessary personal data, and to use the tool's redaction and cropping features before sharing a document.
3. To look after the devices and browsers on which the tool is used: what it keeps stays in that browser's storage until the site data is cleared.
4. To decide which optional features — Google Drive, Google Docs, sharing — are allowed in its environment.

5. Technical measures

1. **Minimisation by architecture:** processing is local, in the browser. The strongest security measure in this Annex is the absence of the data on the Provider's side.
2. **No application server, account or Customer database:** the site and the tool are served as pages by the hosting.
3. **In transit:** the site, the tool and the downloads of libraries and models use an encrypted connection (HTTPS).
4. **Local storage under the Customer's control:** nothing the tool keeps in the browser is sent to the Provider; the copy of a recording in progress is deleted under the conditions of section 2.
5. **Offline version:** the single file the Customer downloads contains none of the external addresses in section 3, and can be kept, scanned and versioned by the Customer.
6. **Google:** `drive.file` scope, limited to the files chosen by the user and those created by the tool, and explicit confirmation before any sending.

The Provider does **not** hold SOC 2 or ISO 27001 certification and does not claim to.

6. Security incidents

As the Provider keeps no Customer content, an incident on its side cannot expose that content. If the Provider becomes aware of an incident affecting the site or the tool that may cause relevant risk or harm to the Customer — for example, an unauthorised change to the code served —, it will publish a notice on the site and make the notifications required by LGPD art. 48.

7. Requests from authorities

The Provider holds no video, audio, screens, transcripts or documents of the Customer and therefore cannot hand them over to any authority. A request about that content must be addressed to the Customer.

8. Verification

The Customer can verify what this Annex states with the browser's network inspector and with the offline version. Upon written request to privacidade@walkstamp.com, the Provider will give the information reasonably necessary to demonstrate what this Annex states.

9. International transfer

The Provider does not transfer Customer content, because it does not receive it. The third parties in section 3 that the browser connects to may be located outside Brazil, and process the technical data of the connection under their own policies.

10. Who had an account before 4 November 2026

Earlier versions of this Annex governed the data of the paid account, kept at Supabase, with Stripe for billing and Brevo for sending e-mails. That system was shut down on 4 November 2026. Account data is erased when the database of the former system is deleted; invoices and tax records are kept for the period Brazilian law requires; and the confidentiality and erasure obligations of those versions remain in force until fulfilled.

11. Term and precedence

This Annex is in force while the Customer uses Walkstamp. In case of divergence between this Annex and the published Privacy Policy, the published version prevails.
